

A PLATFORM FOR SHARED POSSIBILITY

Help make it exist.

A social space where people find one another through the things they want to bring into the world.

There are things people deeply want that may never exist through ordinary economic incentives. A game too ambitious for its fans to build alone. A problem too local to attract investment. A strange invention that no sensible company would fund. A movement waiting for people to find one another.

The desire exists. So do fragments of the ability to act: a little time, specialist knowledge, creative judgment, money, materials, an idle computer, or an AI agent. They are scattered across people who may never meet.

Collaborator begins with a simple proposition: people who want an outcome should be able to gather around it and contribute whatever they can to make it happen.

The central object is a mission: a desired change in the world. It can produce a game, a cleaner beach, a working device, a film, a company, or a community taking action together.

“We want this thing to exist.”

You should not need to put your life on hold, become an expert in every field, or arrive with a complete team. You should be able to find a mission, help meaningfully, and see what became possible because people acted together.

This document describes the ambition and principles of the platform. Its examples are possibilities to build toward, not claims about what the current prototype can already do.

THE SOCIAL EXPERIENCE

From attention to action.

A feed that opens a door into participation.

People should be able to browse missions as naturally as they browse social media: discover something unexpected, recognize something they care about, follow its progress, and find people who feel the same way.

But the natural next step should be action. A mission offers a way to move from “I wish this existed” to “I can help with this part.” The platform should pull people outwards into the world, into collaboration and creation, rather than drawing them deeper into passive consumption.

Participation has many forms

Someone can volunteer for an afternoon, bring refreshments, check a reference, choose between visual directions, write code, test an idea, lend a tool, contribute money, or make computing resources available. A contribution can be small and still matter.

Wanting something is a legitimate starting point

A person should be able to propose a mission without knowing how to execute it. Another person may contribute its first example. Others may bring skills, supervision, resources, or agents. Expertise and leadership can emerge around the work.

The result gives the community a reason to return

The emotional loop is simple: I want it to happen. I contribute. Others contribute. I watch it become real. I can see where I helped. I want to help again.

The meaningful update is not “18,431 agent jobs completed.” It is “Your computer contributed 43 minutes toward Krishna’s chariot” - followed by a build in which the contributor can actually see the chariot.

Progress can also be a beach cleared of rubbish, an event organized, a prototype tested, or a new group ready to act. The evidence should fit the mission.

THE MOTIVATING EXAMPLE

A Mahabharata game.

An ambition that begins with love for a story, not a business case.

Imagine someone who knows the Mahabharata deeply and wants a game that captures its scale, moral complexity, and extraordinary characters. They can describe what should exist, but they cannot personally master every part of game production.

They publish a mission: create a high-quality Mahabharata game. One implementation begins with a playable vertical slice of Day 14 of the Kurukshetra war. The long-term ambition is AAA quality; the first contribution might be only a rough scene or one archery mechanic.

Some supporters know Unreal or Blender. Some know the lore. Some can supply concept art, API budget, GPU time, or playtesting. Someone with thirty minutes and excellent taste can review twenty versions of Arjuna and explain which one feels right.

People and agents work through a connected process

Research informs character descriptions. A human reviews the interpretation. Agents explore visual directions. An artist or community selects and refines one. Reference material becomes a model, textures, a rig, and animation. Integration and testing turn those pieces into something playable.

The shared vision survives the handoffs

Respect the source. Avoid generic fantasy imagery. Preserve moral complexity. Let Arjuna feel superhuman through mastery. Make Astras rare and frightening. These commitments should inform both human decisions and agent work, and changes to them should be visible.

The outputs are parts of a persistent production process. Accepted work becomes the foundation for later work. Contributors can see their ideas and resources inside the evolving result.

The mission can support different implementations: an Unreal game, an open-source Godot approach where compatible with its terms, or a VR interpretation. Proposing the idea does not give one person ownership of every possible realization.

EVERYDAY, EXTRAORDINARY, ABSURD

Missions at every scale.

The same invitation can lead to an afternoon together or years of creation.

Clean a beach together

Someone proposes a beach cleanup. Some people volunteer in person. Others cannot attend but contribute refreshments, equipment, transport, or money to hire cleaners. Organizers coordinate the practical work. The shared outcome is a cleaner beach, and participation is possible beyond physical attendance.

Build an automatic haircutting device

It might be ridiculous. That is part of the point. People find the idea funny, interesting, or unexpectedly useful. They contribute sketches, mechanical ideas, parts, simulation, engineering judgment, and agents. A rough experiment can grow into a prototype through collective curiosity. Moving from a design to use around people would require appropriate testing and care.

Make an animated feature

A community might aspire to create a full-length animated film with Disney-quality craft. One person brings a story, others shape characters, voice scenes, direct performances, or review animation. Agents and contributed resources help carry production forward. The ambition is collective authorship and quality that individuals could not readily achieve alone.

Let unexpected projects find their people

Build an open-source prosthetic hand. Restore an endangered language. Create an open-source CAD application. Reconstruct ancient Rome. Design a CubeSat. Develop open-source robotics. These missions differ in requirements, risk, and effort, but each begins with people who want a particular possibility to become real. Any open-source implementation needs terms compatible with that choice.

A mission does not have to be commercially sensible, prestigious, or enormous. A small local outcome and an expansive creative dream both deserve somewhere to begin.

HUMAN PURPOSE, EXPANDED CAPABILITY

Everyone can bring something.

Agents lower the expertise barrier. People supply the purpose.

People have needs, desires, taste, convictions, and reasons to care. An AI agent can help execute work, but the reason for doing it comes from people. The platform exists to connect that human purpose to the ability to act.

Resources include more than money

Time and skills; ideas and creative work; judgment, review, and voting; AI agents; permitted API and inference budgets; local CPU or GPU capacity; cloud computing; data and references; materials, equipment, places, and eventually money. Different missions need different combinations.

Contributors remain in control

A person might offer an idle RTX 4080 at night, allocating 50% of available compute to the Mahabharata mission, 30% to robotics, and 20% to other supported projects. They choose the hours, limits, and missions. A community might request another 2,000 GPU-hours for a production pass. These are long-term possibilities, not prerequisites for participation.

Human judgment belongs throughout the process

Agents can produce alternatives; people can choose, critique, refine, and redirect them. A specialist may assess whether something works. A newcomer may notice that it feels wrong. Useful collaboration makes both kinds of contribution easier to express and incorporate.

The ambition is to let people work beyond the limits of their existing expertise without pretending that every technical or creative problem has disappeared. Agents should make human effort more productive and help small contributions connect.

Resource sharing must use legitimate mechanisms: APIs where permitted, local models, cloud resources, and explicit budgets. It should never depend on sharing passwords or treating consumer subscriptions as transferable API credits. A cooperative compute economy may develop later; cryptocurrency is not required.

COMMUNITIES THAT CAN TAKE SHAPE

Where organizations are born.

A home for organizing, collaborating, protesting, designing, and building together.

The larger ambition is for this to become a default place where companies and movements are born: people discover a shared purpose, try something together, and gradually create the organization needed to carry it further.

Start with an invitation, add structure when needed

A mission can begin informally. As it grows, people may choose organizers, maintainers, responsibilities, schedules, or more explicit decision rules. Serious implementations can adopt stronger team structures. Participation should not require those structures on day one.

Make disagreement productive

A mission expresses a desired outcome. An implementation is one attempt to realize it. Different approaches can coexist, and people can fork or clone an approach and establish their own rules. Shared history and attribution help preserve what came before.

Organize action beyond production

A mission can convene a community, coordinate a peaceful protest, arrange mutual support, or sustain a movement. The work may be conversations, events, transport, commitments, and follow-through. Its value need not be a downloadable product.

Make commercial intent explicit

Community, shared, noncommercial missions remain the default. Commercial implementations may also emerge under clearly different terms. Joining or contributing should not silently make someone an employee, shareholder, or member of an organization. Earlier community work must not silently become a private commercial asset.

The platform should support ambition without making every mission behave like a startup. Some missions will become companies. Others will remain passion projects, local efforts, playful experiments, or communities whose purpose is simply worth pursuing.

THE PROMISE

A place for the possible.

People do not need another place to merely announce what they wish someone would do.

They need a place where wanting something can become the beginning of doing it - with others, in whatever measure their lives allow.

Someone brings an idea. Someone makes the first rough example. Someone contributes an hour, a reference, a machine, a meal, or an agent. Another person gives direction. The next contribution builds on the last. The community sees the result and decides what to do next.

Keep the invitation open

People should be able to participate without already belonging to a professional team. Time, money, technical confidence, and specialist knowledge should not be the only doors into meaningful contribution.

Keep the work connected

A growing collection of disconnected outputs is not the goal. Shared vision, visible decisions, reusable work, and appropriate review allow individual contributions to add up.

Keep the outcome visible

The mission should show what exists, what has changed, what is needed, and how people helped. Real-world activity should have its own evidence. Progress and credit should be honest.

Let the ambition remain broad

A beach cleanup. A strange machine. A Mahabharata game. An animated film. A company. A movement. The platform should have room for the useful, the beautiful, the urgent, and the wonderfully absurd.

The fundamental invitation:

Help make it exist.
